

Hello and welcome to TEK 100! I'm Katie Thompson

And I'm Tama Thé. And welcome to Module 6, the second part of our two-part ethics program, Navigating AI's Societal Impact. Katie, you built this module for us, tell us about it.

In our last module, we focused on the ethics of AI at the personal level — data privacy, academic integrity, and responsible use. But now we're zooming out. What happens when we look at the bigger picture — the societal systems that AI is reshaping? What are the real-world impacts of training and deploying AI models — on our jobs, our environment, and our communities? And maybe most importantly — who holds the responsibility when AI goes wrong?

This module tackles the large-scale ethical challenges that are built into the system. These are issues that cannot be influenced by any single person or user, and the focus is on the systemic issues of integrating artificial intelligence and the impact on all of our communities. We'll talk about things like AI and the impact on your workforce, the environmental consequences of AI, and finally, look at some AI policy in America.
