

Because the deep research function takes like 30 minutes, we'll have to do this early in the recording for us to be able to talk about the output.

So let's actually try one of these agents out. This will also be your assignment. We're going to use deep research.

For this demonstration and on the assignment, we've recommended using Google Gemini. However, Claude (Anthropic), Microsoft Copilot's paid version, and OpenAI's ChatGPT all have a version of Deep Research.

This is essentially an agent that does research for you. Let's say that you wanted to figure out the most advanced way to wire your smart home or decide the best ways to use a five-acre plot of land in Kentucky for sustainable agriculture. While normally for such complex topics, you would spend hours or even days opening up a bunch of tabs and running down a bunch of avenues and dead ends, instead, Deep Research does it for you.

If you have a paid or trial account of Gemini Pro, you get 20 deep research credits a day, as opposed to a similarly priced plan for ChatGPT, which gets you about 20 per month, and Anthropic, which gives you about five per month.
