Q19: Would you be interested in a follow-up conversation or consultation about generative AI in your unit?	38
Q21: Is there anything else you would like us to know about generative AI needs, opportunities, or concerns in your unit?.....	39

Introduction

This report presents findings from a Spring 2026 survey of Directors of Undergraduate Studies (DUS) at the University of Kentucky, conducted by the CATS AI Education Subcommittee. Fifty-one DUS leaders responded.

DUSs were surveyed because they occupy a particular vantage point: close enough to faculty and students to know what is happening in undergraduate courses, and positioned enough to understand the institutional context their colleagues operate in.

DUS's responses reflect their own observations and what faculty have shared with them. The gaps they describe are reasonable estimates, not complete inventories.

Survey Design, Sample, and Report

The survey was built around what a DUS could reasonably be expected to know — their own experience and what faculty and students share with them. It was designed using the Tailored Design Method¹ and reviewed by CATS AI Education Subcommittee members before distribution via Qualtrics, a web-based survey administration app.

Fifty-one of the DUS leaders invited to participate responded. The 51 who responded chose to engage, which makes this a self-selected sample. We do not know how the non-respondents differ. Where respondents describe uncertainty or uneven awareness among their faculty, treat those as estimates, not audits.

Data were de-identified of DUS names and exported. This report was developed through a systematic, column-by-column analysis of survey data conducted collaboratively between CATS AI Education Subcommittee Member John Nash and Claude (Anthropic), a generative AI assistant. Claude was used for data extraction and counting (via Python/openpyxl), cross-tabulation, analytical interpretation, and drafting sections of report text. Nash directed the analytical approach, made editorial judgments throughout, and reviewed and revised all final content.

Respondents

The 51 respondents represent undergraduate programs from across the university. As promised to respondents, this report does not tie specific responses to named programs. About a quarter of respondents had been in the DUS role less than a year; another quarter had served one to

¹ Dillman, D. A., Smyth, J. D., & Christian, L. M. (2014). *Internet, phone, mail, and mixed-mode surveys: The tailored design method* (4th ed.). Wiley.

two years. Roughly half, in other words, were relatively new. About one in six had served seven years or more. Median tenure was approximately twenty months.

Familiarity and Awareness

Sixty-one percent of respondents rated themselves a 4 or 5 on familiarity with generative AI (where 1 = not at all familiar and 5 = very familiar); 16 percent rated themselves a 1 or 2.

Awareness of university guidance followed nearly the same pattern:

- 63 percent rated 4 or 5 (1 = not at all aware, 5 = very aware),
- 18 percent rated 1 or 2.

The two distributions travel together: the people who know about AI tend to know about guidance, and the people who don't know about one tend not to know about the other either.

This means there are two distinct gaps requiring different support: some programs need AI literacy, others need policy literacy.

Forty-seven respondents answered the open-ended question about whether guidance has been helpful. CELT came up repeatedly and positively — the syllabus boilerplate, the workshops, the Student AI Use Scale.

When guidance has worked, it has been CELT's guidance. Several respondents said so explicitly; one noted that "outside of CELT, I'm not sure I've heard anything useful or productive from the University administration." Another wished the university "supported CELT's work more."

Guidance has functioned as a syllabus-language starter kit. This is a good start, but may not be what faculty need. The most consistent gap respondents described is what happens after a policy is in place: when faculty believe a student has used AI against stated course policy, they find themselves without clear institutional processes to follow and without confidence that the institution will back them if they act.

Several respondents said they needed better detection tools, an understandable ask, but one that reflects the depth of the frustration more than a viable solution; reliable AI detection does not currently exist. The real problem is that the process for addressing suspected violations requires near certainty to move forward, which faculty cannot achieve. One respondent said guidance "offers no real solutions when there are issues." Another described being "left to fend for ourselves."

A second tension ran through several responses. The university has been publicly enthusiastic about AI. Some respondents felt that enthusiasm; not the formal policy language, but the overall institutional climate, complicates their ability to restrict use in their courses. As one put it, "one sometimes gets the impression that the university wants all of us to use it." The policy says instructor discretion; the climate signals something else. Two respondents went further — one

described “serious reservations about the ethical and pedagogical implications of wide-scale implementation” and another said the university is “more willing to go all-in on AI than I and my colleagues are.”

Several respondents noted the guidance is aging. One referenced a Fall 2023 document and asked whether anything newer existed. Another flagged that AI can now log into Canvas and complete assignments — a capability the current guidance does not contemplate.

Finally, some respondents reported never encountering whatever guidance exists. One said simply, “I have not been aware of the guidance.” Another noted it “is not known widely across campus.” This is worth holding alongside the 63 percent who rated their awareness relatively to very aware — that number describes this sample, not the campus.

The Policy Landscape

Respondents were asked whether their program had guidelines or policies on generative AI in three domains:

- course use and assignments,
- academic integrity and misconduct, and
- advising or mentoring undergraduates.

For courses and assignments, half the sample reported having something: 34 percent written, 16 percent informal. Forty percent said no. Ten percent were unsure. Academic integrity policies looked similar: 36 percent written, 20 percent informal, 34 percent no policy, 10 percent unsure. Note that “unsure” from a DUS is itself a finding — if the person responsible for the undergraduate program doesn’t know whether a policy exists, it functionally doesn’t.

Sixty-two percent said no policy exists on AI in advising or mentoring. Twenty-six percent were unsure. Only two programs in the entire sample reported a written policy. Eighty-eight percent of programs have no guidance at all on AI in the advising context. The university’s AI conversation has been entirely classroom-focused, and it shows.

Across all three domains together, 13 programs reported no policy of any kind. If you include programs where the DUS selected “no” or “unsure” on all three, the number rises to 24 — nearly half the sample. Only four programs reported having policy in all three domains.

Those numbers are already striking, but the open-ended responses about actual policy language make them more so. Twenty-four respondents described or pasted their AI policies. What this reveals is that the 34 percent “yes, written” figure for course policies is inflated. In most cases, “written policy” means syllabus language set by individual instructors, not a program-level document. Several respondents said so directly: “Each of our faculty creates their own policy for the courses they teach, so they vary quite a bit depending on each faculty member’s comfort level as well as personal opinions related to ethical use of AI.”

A handful of programs have done genuinely sophisticated work

One program built a four-level framework (the frames are: prohibited, limited, guided, required) that varies by assignment, with a clear disciplinary rationale. Another developed a detailed enforcement protocol: designated detection tool, a patterns-of-evidence standard, a reporting pathway, a structured student meeting process, and documentation requirements. A third grounded its AI statement in the discipline's core intellectual commitments rather than rules, producing a framework that faculty could think with. While these are promising, they are also exceptions.

Most of the AI policies that were pasted into the survey fell into two other categories: prohibition boilerplate (essentially pre-AI plagiarism language with generative AI bolted on), or a statement that each faculty member sets their own rules with no program-level framework.

The real number of programs with genuine, purpose-built AI guidance is closer to seven to ten out of fifty-one.

The picture across the survey's policy questions is this: the institution's approach has been to provide language and hope programs adopt it. That approach has a roughly 50 percent take up rate (or failure rate, depending on how you want to look at it) for classroom policies, a similar rate for academic integrity, and near-total non-takeup for advising.

What's Happening in Classrooms

Respondents were asked how generative AI is currently being used in their undergraduate courses and could select multiple options. The results were:

- Eighty-four percent selected “allowed for limited tasks such as brainstorming and editing,” the near-universal baseline regardless of discipline or stance.
- Forty-eight percent selected “used mainly by students on their own, without explicit guidance” with half the sample acknowledging that students are using AI whether programs have sanctioned it or not.
- Thirty-six percent selected “integrated as a formal learning tool.”
- Thirty-two percent selected “discouraged or prohibited in most courses.”
- Twelve percent said they didn't know enough to say.

These overlap in ways that may matter. Not a single respondent selected “discouraged or prohibited” alone. Every program that reported prohibiting AI also selected at least one other option (most often “allowed for limited tasks”), and in eleven cases, “used mainly by students on their own” as well.

The most common single selection was “allowed for limited tasks” alone (twelve programs). This is the cautious middle ground: some AI is okay for brainstorming and editing, but there has been no broader pedagogical rethinking. It is the floor, and for many programs it is also the ceiling.

The open-ended responses about concrete examples of AI use fill in the texture.

A handful of programs have done genuinely sophisticated work. One physics program built a Socratic AI chatbot that teaches through dialogue, and in a more advanced course requires students to build AI simulations, verify them against their own calculations, and document where the AI gets the physics wrong. A science program has first-year students use Copilot to summarize papers beyond their reading level, and in an upper-division course has students critique AI-generated text for accuracy. One program worked with CELT to build a chatbot that helps students prepare for historical debate simulations. Another described the most comprehensive programmatic approach in the dataset: prohibited courses, courses where students co-write the AI policy with their instructor, and courses explicitly mirroring industry practice, all within one program.

These are exceptions.

Most of what respondents described falls into the brainstorming-and-editing default or, more starkly, into admissions that the assignment-as-assessment model is collapsing. One respondent said flatly: “Students will just put in a prompt and hand in what is produced.” Another described students using AI to summarize books and films rather than reading or watching them. A third noted that “the distinction between brainstorming and composing is very fuzzy for students. They simply want to put an assignment into AI and not worry about the results.” Faculty know what is happening. Many do not have a response to it yet.

Academic Integrity: The Dominant Concern

Academic integrity produced the most lopsided distribution in the survey. Seventy-eight percent of respondents rated concern a 4 or 5 (where 1 = not at all concerned and 5 = extremely concerned). The median was 5 — the maximum. More than half the sample chose the highest possible rating. No other question came close to these numbers.

Forty-three respondents described their most significant integrity-related concerns. Three distinct frames emerge in the responses, and they imply different things about what needs to happen.

The first and loudest is detection and enforcement

Faculty suspect students are using AI against policy, and they have no reliable way to prove it. “Unlike traditional plagiarism, allegations of generative AI misuse are difficult and sometimes impossible to prove,” one respondent wrote. Another described confronting a student in an “egregiously obvious” case — where part of the AI prompt had been included in the submission — only to have the student “defend themselves and accuse the instructor of bias.” A third was categorical: “There are literally no tools on hand to detect, measure, and prove the usage of AI

in any digital product.” Multiple respondents noted that institutional systems, when invoked, often side with the student. The result is that faculty feel unsupported even when they follow the process.

The second frame is learning loss

These respondents are less focused on catching cheating than on what students are failing to develop. “AI can now one-shot most homework,” one wrote. Another described “the substitution of integrative learning with AI-generated responses that mimic such learning.” Several respondents described students who no longer read assigned texts, watch assigned films or write in their own voice. One noted “significant cognitive deficits” in incoming cohorts that make students more likely to turn to AI for foundational tasks, “which leaves them without the skills they need for higher order learning.” The concern here is not rule-breaking — it is that the learning process itself is being bypassed.

The third frame, and the smallest, is pedagogical rethinking

These respondents have concluded that the assessment model itself is the problem. “Many of the assignments we have given in the past are now completely AI-able,” one wrote. “We are having to rethink how we design instruction.” Some programs have responded by shifting weight from homework to in-class exams. Others are redesigning assignments entirely. These are largely the same programs that showed up in the previous section as doing innovative curricular work — a small group carrying a disproportionate share of the adaptation.

One respondent named a paradox worth sitting with: “Enforcing and defining AI use within the realm of academic integrity is more difficult when AI use is allowed.” Programs that permit some AI use have created a harder enforcement problem for themselves than programs that prohibit it outright — but prohibition, as the previous section showed, is not working either.

Familiarity with AI does not reduce concern

Respondents who rated themselves a 2 on familiarity had a mean concern of 4.57; those who rated themselves a 5 had a mean of 4.00. Having a written policy doesn’t help either — 76 percent of programs with written policies still reported high concern. Whatever a program has done or knows, the problem does not feel solved.

What DUS Leaders Say They Need

Respondents were asked to select up to three forms of support that would be most useful. Every option cleared 50 percent:

- workshops or training at 71 percent,
- assignment redesign consultations at 62,
- student-facing resources at 60,

- guidance on academic integrity procedures at 58,
- communities of practice at 52, and
- syllabus and policy templates at 50.

This is not a population with focused needs. It is a population that wants help across the board.

A pattern that a cross-tabulation reveals

Among respondents at the highest concern level (those who rated academic integrity a 5) the top choice was guidance on academic integrity and misconduct procedures, selected by 73 percent. Workshops dropped to 54 percent.

Among those with the second-highest concern, level 4, workshops and assignment redesign both rose to 69 percent, while integrity guidance fell to 23 percent.

Among those at concern level 3, workshops hit 100 percent.

The gradient is clean:

- The more worried people are, the less they want training and the more they want institutional backing.
- The less worried they are, the more they want skill-building.

A single support menu will not serve both groups.

The open-ended responses about pressing needs sort into four orientations

The first is **integration**. Respondents whose advisory boards or industry partners expect graduates to use AI well. One wrote: “Our advisory board was quite clear that graduates are expected to use these tools and use them well.”

The second is **pedagogical rethinking**. Respondents who have concluded their assignment models need redesign. One described the tension precisely: “assignments seem pointless, tedious — instructors need to be much more creative in how they educate and understand that the same old methods often were not great to begin with.”

The third is **institutional support**. Respondents who want the university to make policies mean something. “We want to feel like our concerns and worries are heard and echoed by the university instead of wondering if the institution’s priorities are going to leave us behind.”

The fourth is **existential**. Respondents, primarily in the humanities, who feel their disciplines are under threat. “English professors, and the humanities in general, are in crisis about AI. We feel there is little to no institutional support, or even societal support, for teaching students that AI-generated ideas and content is not the same as thinking and writing for themselves.”

One respondent identified a structural constraint worth naming: UK Core requirements “lock us into very traditional assignments, when we know those are now the easiest to cheat using AI.” The institution is mandating assessment formats that its own faculty say no longer hold up. Another noted that placing student conduct processes under Student Success may disincentivize enforcement.

What would help them feel confident and effective

When asked what would help them feel confident and effective, several of the most experienced and AI-literate respondents said some version of “I don’t know.” One said, “Not sure. But we are scared.” Another: “I think it is moving too fast for anyone to be confident. If you are confident, you are probably wrong and way behind.” This is not a training gap. It is a disorientation gap. These are not people who need a workshop. They are people whose professional landscape has shifted underneath them and who do not yet see a stable place to stand.

Cross-Cutting Patterns

Four patterns emerge when the data is examined across questions rather than one at a time.

Familiarity doesn’t predict policy

Among respondents who rated themselves highly familiar with AI, 39 percent reported no program-level course policy — nearly identical to the 42 percent among those with lower familiarity. Being personally comfortable with AI tools does not translate into having institutional frameworks in place.

Concern about academic integrity is universal, and nothing in the data reduces it

Eighty-four percent of high-familiarity respondents reported high concern — but so did 68 percent of low-familiarity respondents. Having a written policy didn’t help either: 76 percent of programs with written policies still reported high concern. Whatever a program has done or knows, the problem does not feel solved by awareness or policy alone.

The prohibition paradox group

Eleven programs simultaneously reported discouraging or prohibiting AI and acknowledged that students are using it on their own without guidance.

This group has a mean concern level of 4.82, the highest in the dataset, and a mean priority of 4.18, also above the overall average. Seven of these eleven have no formal course policy.

These programs represent what happens when the institution provides language but not infrastructure: prohibition at the syllabus level, unenforceable in practice, with faculty watching it fail.

Some in this group are ready to move forward; they want examples, best practices, help redesigning away from prohibition. Others are demanding that the institution make prohibition

enforceable if it is going to remain an option. A few have concluded the situation is beyond remedy and have stopped asking for help.

Support demand is not driven by ignorance

Among highly familiar respondents, 68 percent wanted workshops; among less familiar respondents, 65 percent. The demand for support is broadly distributed. This is not a population asking for help because they don't know anything. It is a population asking for help because what they know is insufficient for what they are facing.

Priority and Capacity for Follow-Up

Sixty-five percent of respondents rated AI support a 4 or 5 priority for their program over the next twelve months (where 5 = very high priority), with a median of 4. Only four respondents rated it low priority.

That 65 percent sits below the 78 percent who rated academic integrity a high concern. Eleven respondents reported high concern but low priority — a gap that likely reflects concern without hope. These are people who are worried but do not believe support will come or will be adequate if it does.

Asked whether they would be interested in a follow-up conversation, 39 percent said yes and 33 percent said maybe — 72 percent open to further engagement. Priority predicts this cleanly: among those who rated priority a 5, 78 percent said yes; among those at priority 4, 87 percent said yes or maybe. Among those at priority 3, 54 percent said no.

Twelve respondents reported high concern about academic integrity but said no to follow-up

These are not apathetic people. Several wrote some of the most forceful open-ended responses in the survey — about AI threatening their disciplines, about the institution becoming a “degree mill,” about wanting “respect for our expertise and job security.” They are disillusioned. They have concluded the institution will not deliver meaningful change on this issue. Reaching them will require something different from a workshop invitation.

The final open-ended question drew thirteen responses. One put the institutional choice in blunt terms:

“Either provide us with useful AI utilization tools or give us the time and space to develop meaningful assessments and course structures that permit truly creative work. Otherwise, UK will become a degree mill.”

Two respondents raised environmental concerns about AI's resource demands — “increasing the cost of living and compromising water and electrical supply chains for hundreds of thousands of Kentuckians.” This is a minority voice but a consistent one, and it represents a values-based objection that training will not resolve.

What This Survey Cannot Tell Us

This survey has the following limitations.

The 51 respondents are self-selected. They chose to respond, which likely means they are more engaged with the question of generative AI than those who did not. The survey cannot tell us what is happening in programs whose leaders did not participate, and it would be a mistake to treat these findings as representative of all undergraduate programs at UK.

DUSs report what they know — their own experience and what faculty share with them. No DUS has complete visibility into every course. Where respondents described widespread AI use by students, or faculty who are not addressing the issue, those are informed estimates. The actual picture in any given program may be more or less serious than what its DUS reported.

The survey cannot tell us what students are experiencing or thinking. It captures the faculty and administrative perspective on a problem that involves students centrally. What students understand about university expectations, why they use AI the way they do, and what they actually need are questions this data cannot answer.

It also cannot distinguish between programs where policy absence reflects a deliberate stance and programs where it reflects neglect or overwhelm. A program with no written AI policy may have had extensive faculty conversations and decided against codification. Or it may simply never have gotten around to it. The survey treated both the same.

Finally, this was conducted at a particular moment. The situation is changing quickly. Some of what respondents described — specific tools, the state of detection technology, what AI can and cannot do — may already be different. The findings are a snapshot, not a stable baseline.

Implications and Recommendations

Stop sending mixed signals

The university's public enthusiasm for AI and its formal stance of instructor discretion do not coexist cleanly at the program level. Faculty who want to restrict AI use feel the institutional climate working against them. Faculty who want to integrate it feel unsupported in a different way. The subcommittee should recommend that institutional messaging acknowledge this tension directly rather than papering over it.

Enforcement is the gap that most needs addressing

Guidance exists. CELT has done real and valued work. What is missing is institutional backing when policies are violated. Faculty describe confronting students about obvious AI misuse and losing. They describe a process that is cumbersome and inconsistent. The data shows a clean gradient: the most concerned respondents are not asking for workshops — 73 percent of them are asking for guidance on academic integrity and misconduct procedures. One program has built a detailed enforcement protocol on its own. That kind of concrete procedural infrastructure should not be left to individual programs to reinvent.

Differentiate the support

The data describes at least three distinct populations. Programs focused on integration need curriculum design help and industry alignment. Programs in the cautious middle need examples, peer learning, and assignment redesign support. Programs that feel besieged — primarily in the humanities and writing-intensive disciplines — need institutional validation that what they teach matters and that enforcement of their policies will be taken seriously. A single support menu will not serve all three.

Address the assignment crisis

Traditional homework, take-home essays, and research papers are now routinely AI-completable. Faculty know this. Many are changing their assessments without support. UK Core was named specifically as a structural constraint that locks programs into assessment formats that no longer hold up. This is an institutional problem requiring an institutional response, not a series of individual faculty workarounds.

Expand CELT's capacity to match the demand

CELT was the most frequently praised resource in the survey. Seventy-one percent of respondents want workshops and training. Sixty-two percent want assignment redesign consultations. The infrastructure to meet this demand needs to exist.

Engage those willing to follow up

Seventy-two percent of respondents expressed willingness to engage in a follow-up conversation. The programs most willing to engage are already identified. The subcommittee should use this survey data to initiate targeted consultations — particularly with programs that show high concern but low policy development, and with the handful that have built thoughtful frameworks others could learn from.

Reach the disillusioned

Twelve respondents reported high concern about academic integrity and said no to follow-up. These are not apathetic people. They wrote some of the most forceful responses in the survey. They have concluded the institution is not serious about this. A workshop invitation will not reach them. Something structurally different — a visible institutional commitment, an enforcement infrastructure that works, a direct conversation at the program level — might.

What the Subcommittee Should Ask Next

This survey identifies the shape of the problem. It does not explain it fully. The next questions worth asking: What do students understand about current expectations? What has changed in how students perform since AI became widely available? Where programs have developed strong frameworks, what made that possible? Where programs have disengaged, what would it take to bring them back? Those questions require different methods, but this survey has helped identify who to talk to and what to ask them.

Appendix A: Response Distributions

Q3: How would you rate your current familiarity with generative AI?

N = 51. Mean = 3.65. Median = 4. Scale: 1 = Not at all familiar, 5 = Very familiar.

Response	Count	%
1	1	2%
2	7	13.7%
3	12	23.5%
4	20	39.2%
5	11	21.6%

Q4: How aware are you of your college/university's current guidance or policies on generative AI in teaching and learning?

N = 51. Mean = 3.57. Median = 4. Scale: 1 = Not at all aware, 5 = Very aware.

Response	Count	%
1	2	3.9%
2	7	13.7%
3	10	19.6%
4	24	47.1%
5	8	15.7%

Q5: In what ways, if any, has this guidance been helpful or unhelpful?

47 responses. Identifying information has been removed to protect confidentiality.

1. It has been helpful in thinking about AI-related policies to include in class syllabi.
2. I appreciate that they had some boilerplate language for us to use in our syllabi. I appreciate that instructor discretion is allowed per class. I think it is really hard to figure out how to handle AI use when it is not permitted in my courses. For example, I currently have a student that I know has been using AI in my course against my syllabus policy. However, I can't prove it. I have even put the text from assignments into AI detectors, which indicate that my suspicions are correct. However, the university indicates that we can't use these tools as punitive. It is hard to know how to proceed.
3. The guidance I have read is in the document "Fall 2023 Guidelines and Recommendations for Generative AI in Instructional Contexts". If there is other guidance, I am unaware of it. The document refers a number of topics to the University Senate rules, which seems out of date now. Overall, though, I find the document provides good ideas and information on Generative AI use. As Generative AI capabilities are changing rapidly, it should be updated more regularly.

4. Provides flexibility in lesson and course planning
5. It's been slightly unhelpful in understanding how we, as faculty, can enforce not copying and pasting from AI. Since there is no "certified" tool to detect when students do it, it makes hard to give students deduction in their grades. It's frustrating because we would like students to develop critical thinking but most just want to take the easy way out by copying and pasting from AI
6. I think it's been made clear that the university advocates for AI usage, but I have not heard equally clear messaging regarding things like the situations in which students should not use AI, and the consequences (intellectual, personal, academic, etc.) of doing so.
7. To my knowledge, the guidance is pretty vague, although that may have changed over the years. It would be great if it provided a concrete set of best practices, or at least more targeted examples of how to best utilize generative AI in the classroom.
8. Its very general and leaves much of the monitoring of AI usage to instructors. Its the kind of general policy I would expect.
9. Helpful when thinking about how to address AI misuse
10. I'm not very familiar with the guidance
11. The lessons from CELT are great. I appreciate that we don't have blanket "Do not use." statements. One area of improvement would be more clarity on our copilot agreement. Based on UK trainings, I understand that we can't share or post student work or records. We have to use local (Office or other programs on our computers) or compliant cloud services like Canvas, Google Drive or OneDrive for these tasks. This implies that I could use locally hosted LLMs in grading and student record management, but not consumer AI products like ChatGPT or Claude. However, UK does have enterprise agreements with Microsoft and Google, so it is unclear how you can use these services.
12. Although the guidance seems to support diverse approaches to generative AI in the classroom, it's sometimes hard to reconcile that with the university's overall championing of AI. Although university guidance seems to allow instructors to limit or forbid generative AI use in the classroom, one sometimes gets the impression that the university wants all of us to use it. This isn't a problem with the guidance itself, but the guidance can be hard to interpret within the broader context.
13. Overall, helpful-- there has been nuanced discussion and guidance regarding the varying level of appropriateness or helpfulness of generative AI.
14. Helpful for instructors thinking about how to incorporate AI use into their curricula or restrict its misuse. But we need guidance and policies specific to teaching in our discipline, and we are developing our own guidelines.
15. Our department met with CELT before the start of the academic year to implement the Student Use AI Scale ([URL removed])
16. I have used past versions of the GenAI statments in my syllabus. I saw the more robust guidance and graphics when I was prepping syllabus this semester, but did not directly use it to update my syllabus. I have also referred some faculty to the resources if they did not know about them.
17. I have serious reservations about the ethical and pedagogical implications of wide-scale implementation of AI-based technologies, so I don't feel that guidance that does an adequate job of truly and meaningfully addressing these issues.

18. The university seems to be more willing to go all-in on AI than I and my colleagues in our discipline are. We are incorporating it very selectively into our teaching. We are committed to helping students learn to think and communicate in sophisticated ways on their own.
19. I have not been aware of the guidance.
20. Gives faculty a baseline on which they can build their class policies.
21. This guidance has been helpful, and I wish the university supported CELT's work more. It seems that higher education in general is being reactive to these technologies rather than proactive, and it's a terrible inefficiency to re-invent the wheel here while kneecapping CELT's good work.
22. It helps with syllabus templates.
23. For incorporating GenAI into course assignments and establishing student expectations for best practices when using it.
24. Somewhat helpful
25. CELT has been a great resource for helping our program faculty understand and incorporate AI usage in the classroom. The Ombud's office has been very helpful when questions on ethical use has come up.
26. Has allowed me to provide guidance to my students.
27. It is fairly vague and needs clearer instructions to be more useful
28. Helpful, my job is to figure out what is best by conferring with others in engineering education field and industry partners.
29. Helpful: providing boilerplate language around use Unhelpful: no real suggestions on how to navigate rampant unpermitted use in the classroom, defaulting to CoPilot for login screens (students already struggle with problem solving and tech troubleshooting)
30. The guidance allows flexibility for faculty but offers very little support for enforcing violations of AI policies.
31. It provides language but no real solutions when there are issues. The AI is evolving faster than policy, for example, the new AI that can log into Canvas and complete assignments. Students also don't take it seriously as a violation of academic integrity.
32. Useful to reference when developing syllabus language
33. Has helped me craft statements for my syllabus, brainstorm activities to use in class that uses AI responsibly, etc.
34. The university has not appeared to say much about it. We do need some controls in place.
35. I haven't really delved on it since I am quite open with students using AI as much as they want without it impacting how I assess them.
36. It has been helpful in providing students with guidance for what is/is not allowed in their use of AI for course assignments.
37. I appreciate that the guidance defers to instructor preference in their courses and feel strongly that it should stay that way. I do think the guidance of abusing instructors' AI policies (whether or not it counts as plagiarism, academic misuse, etc) is nebulous and should be clarified.

38. It has been helpful for me but I don't think it is known widely across campus. Having more workshops and more visibility would be highly beneficial.
39. It sets a standard.
40. Not been super helpful mainly because its use varies so widely between programs, departments and colleges.
41. It has been unhelpful. As a humanities program professor, UK's lack of an institutional standard on AI use means we are left to fend for ourselves and try to manage student usage on an ad hoc, situational basis.
42. Helpful on an individual level, but no sense of a campus wide policy
43. Helpful in creating class policies for AI. Unhelpful in crafting assignments that navigate the ever-changing nuances of student AI use.
44. The CELT workshops have been extremely helpful in outlining university guidance, introducing ways to accommodate AI, and offering workshops on incorporating AI into our courses. I also took advantage of the opportunity to participate in CELT's TII in 2024-2025.
45. My understanding was that the University's position is instructor's choice with very little in the way of guidance. Outside of CELT, I'm not sure I've heard anything useful or productive from the University administration when it comes to gen AI.
46. The guidance has been helpful for my understanding of the risks and capabilities. Additionally, the CELT resources have been useful for shaping course policies and navigating students inquiries.
47. I understand and agree with the purpose and direction of the AI policy and guidance, but I personally believe that its effectiveness is significantly reduced because the scope and limitations of Generative AI are still unclear.

Q6: Does your unit/program/department currently have any written or informal guidelines/policies about generative AI use in courses and assignments?

N = 50.

Response	Count	%
No	20	40%
Yes - written	17	34%
Yes - informal	8	16%
Unsure	5	10%

Q7: Does your unit/program/department currently have any written or informal guidelines/policies about generative AI use in academic integrity and misconduct?

N = 50.

Response	Count	%
Yes - written	18	36%
No	17	34%
Yes - informal	10	20%
Unsure	5	10%

Q8: Does your unit/program/department currently have any written or informal guidelines/policies about generative AI use in advising or mentoring undergraduates?

N = 50.

Response	Count	%
No	31	62%
Unsure	13	26%
Yes - informal	4	8%
Yes - written	2	4%

Q9: If yes, please briefly describe or paste key language.

24 responses. Identifying information has been removed to protect confidentiality.

1. It is the same language supplied by the Provost's office.
2. There is no doubt that artificial intelligence is here to stay thus, understanding how to appropriately work with it is important. At this stage in your academic journey, it is imperative that you take responsibility for your own learning. This includes having original thoughts, reflective statements, and using critical thinking. While AI can be used for potential idea generation, it cannot be used to generate your assignments. Copying and pasting for an assignment in this course will result in a grade of zero. If you use AI in any capacity of an assignment, you must make sure to denote that in your assignment submission. Remember, you have invested a great deal in tuition, fees, and time to be at this university. You will gain more from the course when you take on a growth mindset rather than depending on AI to be your brain
3. Our course coordinators for [a course], 111, 112, and 300 each determine the AI policy for their courses, or in some cases extend the option of creating policies to the individual instructors.

4. This is a sample used on some faculty syllabi: Artificial Intelligence (AI) Policy: Generative Artificial Intelligence (AI) The increasing use of generative AI tools is transforming and disrupting practices in art, science, medicine, business, and many other human activities. In this class, students are allowed to use generative artificial intelligence tools to complete studio assignments, but there are two restrictions—disclosure and appropriate use 1. Disclosure: If generative AI is used at any stage of an assignment (research, brainstorming, generating text or images, layout, editing, checking for errors, or even presenting the work), it must be disclosed when the assignment is submitted. For text or images included in written work, such as essays or papers, appropriate citation is required. See [URL removed] to an external site. for style recommendations. 2. Appropriate Use: Generative AI should not be used to bypass the learning goals or intended process of an assignment. For example, if an assignment involves creating a logo through an iterative design process of brainstorming, sketching, evaluating, and refining a design, students may not use AI to generate a logo through prompt engineering instead. If there is any uncertainty, students should consult with their professor. Failure to observe either of these restrictions will be considered as academic dishonesty. Generative AI tools are rapidly evolving and can be a sensitive and divisive topic—especially in the arts. Please note that the policy mentioned above is not universal at UK (or even within SA/VS). Students should respect the policies established by their professors on a class-by-class basis.
5. I don't have access to the document at time of survey completion; however, the policy generally states that students are allowed to use AI to help with idea generation and for editing but they must disclose how they used it.
6. Use of generative Artificial Intelligence (e.g. Chat GPT) except when specifically authorized by the professor is not permitted. Students using generative AI and making its work out to be their own are committing an academic offense. You are expected to adhere to the university's policy on academic integrity. Fabrication, plagiarism, cheating and other violations of the code will not be tolerated in this course. When you are using other people's ideas to make a point, you must give the source credit through proper attribution. Merely cutting and pasting Web site information into your assignment without attribution is wrong and a resulting charge of plagiarism can result in a failing final grade for the course. Honors students that are found guilty of an academic integrity violation through the University's Academic Ombud office will be dismissed from the an honors program.
7. Students will be permitted to use Generative AI (GAI) in this course for specified assignments as designated by the instructor. That use will be indicated using the GAI Use Scale (see chart below) and, if needed, additional expectations that the instructor clearly establishes. UK CELT Student Generative AI (GAI) Use Policy: [URL removed] For more information on how students should use AI in school, download the following guide: Rationale Because Generative AI (GAI) is an influential tool for the future of a health sciences program it is important that students engage with that tool in thoughtful and inquisitive ways. When GenAI tools can be used on an assignment it will be explicitly stated in the directions. At times, instructions may also indicate the specific AI tool you can use. The goal of allowing the use of GenAI for these assignments is to make space for critical engagement and practice with these tools. Any use of AI beyond the assignments and tasks the instructor approves will be considered misuse. Ethics and Responsible Use Regardless of the situation, any AI-generated citations, data, language, and other content should be verified using reputable, discipline-specific sources and/or methods. In addition, entering or uploading identifiable client, patient, or peer (i.e., fellow student) information into AI tools (including speech samples, case histories, or diagnostic data) into third-party AI tools can violate privacy laws such as FERPA and HIPAA. Academic Misconduct Use of AI may constitute an

academic offense. If a student uses AI to complete assignments, clinical documentation, or case studies: - without substantial human input or revision, - without clearly indicating the use(s) of AI, or - if AI use is not allowed for the specific activity. Consequences for academic offenses will follow University policies. When in doubt, always ask your instructor about the expectations for assignments.

8. As a profession, historians have long embraced new technologies and perspectives as we continually reflect on and revise the way we study the past and the stories we tell. The Department of a humanities program is committed to offering students, colleagues and the public we serve a range of pathways for understanding the past. In some cases, this commitment means making use of large language models (LLMs), artificial intelligence (AI) and other digital tools in research and teaching. In others, it means privileging pedagogical and research methods designed to gather and interpret undigitized sources; to provoke deep engagement with texts; and to hone an array of written, oral and multi-media communication skills. Regardless of the tools used, the Department of a humanities program remains committed to the core principles of the profession. In pedagogy, this commitment means teaching students the skills of documentary analysis (hermeneutics), empathy and argument-based narrative. In research and in teaching, this means a shared commitment to academic honesty and integrity. Our work must always be grounded in verifiable, traceable evidence. As a humanistic discipline, our work must always preserve a respect for the humanity of the people whose lives we study; for our colleagues and those who came before us; and for our readers and students today. To best fulfill these obligations and priorities, it is imperative that experimentation with and implementation of AI in pedagogy be at the discretion of faculty.
9. The statements are course by course. Here is an example from our Spring 2026 [a course] syllabus. Use of Generative AI: Because a major focus of this course is on developing your skills and fostering creativity in [writing, argumentation, and critical thinking], you must complete assignments for this course entirely on your own. You may not copy from any online sites (e.g. Course Hero or Chegg) or utilize composition technologies (e.g. ChatGPT or other GenAI software). Work submitted by students—all process work, drafts, low stakes writing, final versions, and all other submissions—will be generated by the students themselves. For the purpose of this course, any use of these sites or tools will be considered academic misconduct and consequences will follow University policies. If you have any questions or concerns about this policy, contact your instructor before submitting any assignments.
10. This course recognizes that generative artificial intelligence (AI) tools are increasingly used in scientific, professional, and educational contexts. Accordingly, AI use in this course is permitted, required, limited, or prohibited depending on the specific assignment and learning objective. Students are responsible for understanding and following assignment-specific instructions regarding AI use. AI use in this course falls along the following spectrum. Each assignment will clearly indicate which category applies.
 1. Prohibited Use For some assignments, the use of generative AI tools is not permitted. These assignments are designed to assess individual knowledge, skills, or reasoning without AI assistance. Use of AI on these assignments may constitute an academic offense.
 2. Limited or Assisted Use For some assignments, limited use of AI tools may be permitted for specific purposes, such as:
 - Brainstorming ideas or questions
 - Clarifying terminology or concepts
 - Editing for grammar or clarityIn these cases, AI may not be used to generate substantive content, analysis, or conclusions

unless explicitly stated. Students must follow all assignment-specific limitations.

3. Guided or Documented Use For some assignments, students may be instructed to use AI tools in a structured way, such as:

- Generating sample outputs for critique
- Comparing AI-generated results to human analysis
- Evaluating strengths, weaknesses, or errors in AI outputs

These assignments may require students to describe how AI was used or to submit reflections on AI performance.

4. Required Use For some assignments, use of generative AI tools is required as part of the learning activity. In these cases, AI is treated as a tool for experimentation or analysis rather than a replacement for student learning. Students remain responsible for interpreting, evaluating, and contextualizing AI-generated outputs. Regardless of the level of permitted AI use, students remain fully responsible for all work submitted. AI-generated content may be inaccurate, biased, incomplete, or misleading. Students are expected to critically evaluate all outputs and verify information before submission. Important Considerations: Misrepresentation of AI-generated content as original student work, use of AI outside assignment guidelines, or failure to follow documented AI-use instructions may constitute an academic offense under university policy. When required by an assignment, students must disclose how AI tools were used. Failure to provide required disclosure may result in a grade penalty.

11. The business school as a good AI education offering through our AI committee chaired by [a faculty member]. I am on that committee. There is a sharepoint page with a great deal of genAI training in policy information.
12. We provide the university guidance on AI policies in our teaching handbook, which we provide copies of for all faculty.
13. We use the recommended language in the syllabus for AI and academic honesty from CELT.
14. We allow faculty to set (or not set) AI policies in their courses. Generally, I think we all informally agree that students should not be using AI to complete course assignments for them (e.g., answering exam questions, generating text for written assignments, etc.), unless engaging with AI is a requirement of an assignment. However, there is concern that there is no formal mechanism for enforcing these policies (like an official academic integrity violation report).
15. We don't have a department or program level policy- each of our faculty creates their own policy for the courses they teach so they vary quite a bit depending on each faculty member's comfort level as well as personal opinions related to ethical use of AI.
16. AI@a business college Version: January 7, 2026. Prepared by the a business college AI Integration Team. Microsoft Copilot assisted with brainstorming and light copyediting. AI Tools for a business college Students Key: Course syllabus is where you will find the course's AI policy. Follow your instructor's rules for what AI is allowed. Most courses require you to disclose AI use, cite when appropriate, and verify anything an AI produces. Assignments may require an AI Usage Statement describing which tools you used and how. When in doubt: ask your instructor before submitting work. Key General Tools: • Microsoft Copilot Chat (UK-provided) [Link]: Brainstorming, summarizing readings, improving writing. • Adobe Express (UK-provided) [Link]: Posters, infographics, and presentation visuals. Sign in with UK/LinkBlue credentials. • NotebookLM (Google) [Link]: "Study with your sources": use allowed notes/readings/slides to create study guides and Q&A. • Gemini for Students (not a UK- provided tool) [Link]: Student offer may include pro-tier features. Analytics / Programming Tools: • GitHub Copilot for Education [Link]: Coding

suggestions + debugging. • Google Colab [Link]: Python/data science notebooks (cloud-based). Education benefits vary by availability/verification. Other Common Tools (PUBLIC): ChatGPT, Claude, Grok You can use these for brainstorming, outlining, and practice explanations, but they are not official UK-provided services. Treat them as public tools: do not upload confidential/sensitive information, and always verify facts/citations. Privacy & Academic Integrity • Do not paste/upload any confidential info (student records, grades, private info, internship/employer confidential data). • AI can be wrong. You are responsible for accuracy (fact-check, verify citations, etc.). • Transparency matters. Carefully follow your course's disclosure requirements. Prompting Ideas 1. Study guide + practice: "I'm studying [topic]. Explain it simply, then give a worked example, then quiz me with 5 questions. Wait for my answers before grading." 2. Company briefing: "Act as a business analyst and provide a concise one-page briefing with citations on The Coca-Cola Company. The report must include: (1) current top management team, (2) primary product markets, and (3) capital structure as of January 2026." 3. Writing improvement (not writing-for-you): "Here's my draft [paste]. List 5 improvements (clarity, structure, logic), then rewrite for conciseness while keeping my meaning. Don't add new claims."

17. Using AI for composition assignments is cheating. Because a significant focus of this course is on developing your skills and fostering creativity in writing, argumentation, and critical thinking, you must complete assignments for this course entirely on your own. You may not copy from any online sites (e.g. Course Hero or Chegg) or utilize composition technologies (e.g. ChatGPT or other GenAI software). Work submitted by students—all process work, drafts, low-stakes writing, final versions, and all other submissions—will be generated by the students themselves. For the purpose of this course, any use of these sites or tools will be considered academic misconduct and consequences will follow University policies. If you have any questions or concerns about this policy, contact your instructor before submitting any assignments. If and when the use of AI is allowed, this will be made explicitly clear in the assignment instructions. For nearly all assignments in this course, the use of GenAI to complete any part of the submitted work is prohibited unless explicitly specified by the instructor. In instances where specific instruction/permission to use GenAI tools is provided, students must acknowledge any work that is not their own. This includes citations for outside scholarship or information gathered from other sources. If you have any questions or concerns about this policy, contact your instructor before submitting any assignments.
18. This guidance accompanies the updated Artificial Intelligence (AI) Use Policy (Interim) included in your course syllabus. It outlines the process for handling concerns about potential unauthorized AI use, protecting student rights, and ensuring consistent documentation.
 1. Use Only the Authorized Detection Tool Turnitin, already integrated into the Canvas LMS, is the only authorized AI detection tool for use at this time. Faculty may not copy or upload student work into any other third-party AI detection tools or websites. Turnitin's AI detection results should be treated as one piece of evidence and never as the sole basis for determining unauthorized AI use. These tools cannot fully keep pace with AI advancements and are prone to both false positives and false negatives.
 2. Look for Patterns of Evidence. Concerns should be based on multiple clear, observable indicators rather than a single sign or a perception alone. Faculty should review patterns across the student's work, including writing style, vocabulary, formatting, citation use, and the presence of broad or generic statements that lack specificity. Comparisons should be made across multiple assignments or discussion posts to determine whether the current submission is consistent with the student's typical work.
 3. Follow the Reporting Pathway. For course-coordinated courses, notify the Course Coordinator. For non-course-coordinated courses, notify the Program Director directly before scheduling a

meeting with the student. All notifications to students must be made via official UKY email from your official UKY email.

4. Begin with a Student Conversation. The first step is to meet with the student. In the course coordination model, you will want to meet with the student and the course coordinator at the same time. During the meeting with the student, you will want to accomplish the following:

- Explain to the student that their submission appears inconsistent with prior work;
- Ask how they completed the assignment;
- Reference the syllabus AI policy as the standard for evaluation;
- Discuss whether resubmission will be allowed, if allowed in the program's handbook; and,
- Advise the student of their rights to appeal grade decisions (see Ombuds resources below)

5. Document the Interaction Follow the conversation with an email to the student's official UKY email summarizing your concerns and referencing the AI policy in the syllabus. Recap what the student shared about their process and outline next steps if a resubmission is permitted and any grading implications. Maintain a factual and neutral tone, and again close the email with notification to the student of their rights.

6. Submit an ASPIRE Alert. Submit an ASPIRE alert following the Student Concerns Routing Guide (requires SSO). This step is essential to ensure students receive the right academic and behavioral supports. The alert helps track concerns across courses and programs, along with preventing students from falling through the cracks.

7. Protect Student Privacy. Do not share student work beyond what is required for this process. All sharing must comply with FERPA and should be limited to individuals who are part of the official review and decision-making process. Summary Following this guidance protects both faculty and students, ensures due process, and supports academic integrity. If you have questions about applying the policy or documenting a concern, please contact your Program Director or the ADASA's office for additional guidance. Resources CoSW Course Policies on Plagiarism, Cheating, and AI Use (Pages 4-5) Academic Misconduct Process

19. FROM ONE SYLLABUS ... As is the case in most newsrooms today, you should NOT use AI to create content or to "write" your writing assignments (unless otherwise noted in the syllabus or on the assignment), but you can use it to assist in the writing and editing processes. If you use AI tools or apps for work in this course, you MUST disclose, in writing, what tool you used, how you used it and any prompts you utilized, including follow-up prompts. This is part of the learning process in the era of AI experimentation and will also be noted on the assignments. AI cannot be used for quizzes or tests. If you are unsure whether AI use is acceptable on a particular assignment, please talk with your instructor before turning it in and let's figure it out. FROM A DIFFERENT SYLLABUS (most professors in JOU tend toward this one) ... All materials – scripts, videos, graphics, social media posts, etc. - that you submit must be written, shot, edited or otherwise produced by you. You may not copy from online sites or use technologies like ChatGPT. If you feel you have a justifiable reason for using AI-generated materials (an AI-themed show, a demo about the tech, etc.), you MUST speak with the instructor and lay out a clear plan for which materials are appropriate. Otherwise, materials generated by anyone or anything other than you will be considered academic misconduct and consequences will follow University policies.
20. Each professor decides their own AI use policy. As a department we recommend they use CELT's language for their syllabus. Most professors prohibit the usage, but there isn't a department-wide policy.
21. This is language taken from my lab syllabus that I largely adopted from a fellow instructor. Generative AI Policy The primary purpose of this course is to enable you to develop your skills in

conducting laboratory investigations, analyzing data obtained, and communicating your analysis and relevant interpretations in a way that can be broadly understood by non-specialists. While generative AI tools can be a useful aid in accomplishing some of the goals in this course, they should not be viewed as a replacement for your own scientific understanding, technical knowledge, and interpretations. In a 400-level course I do not expect expert-level proficiency and knowledge of any of the concepts we will cover. What I do expect is that you utilize the knowledge you do have to analyze and interpret your results in a logically consistent manner. For this reason, the use of generative AI tools to produce text for an assignment related to descriptions of the tools, techniques, concepts, and phenomena under consideration in this lab is not allowed. On the other hand, generative AI tools can be very helpful to assist you in communicating your own knowledge and expertise in a way that is clear and understandable. You may use generative AI tools to edit and modify your text for clarity and communication purposes. To ensure generative AI tools are used in a way that is consistent with the aims of this course, all written assignments must have a “Generative AI Usage Disclosure Statement” included. If generative AI tools were not used, then a simple statement affirming as such is sufficient. In this disclosure you must include screenshots of all input and output from your use of generative AI that contributed to your completion of the assignment. Appropriate text and headings should be included that make clear what the aims and goals of each prompt and where output text was used in the assignment. Failure to disclose the use of generative AI tools will be considered as plagiarism and will be subject to course and university policies. Students are encouraged to proactively ask if certain usage of AI tools is acceptable before the due date of any assignment.

22. UK policies on academic offenses are available at [URL removed] Plagiarism From AR-ASA 6.3.2.1: “All academic work, written or otherwise, submitted by students to their instructors or other academic supervisors, is expected to be the result of their own thought, research or self-expression. In cases where students feel unsure about a question of plagiarism involving their work, they are obliged to consult their instructors on the matter before submission. When students submit work purporting to be their own, but which in any way borrows ideas, organization, wording or content from another source without appropriate acknowledgment of the fact, the students are guilty of plagiarism.” For a complete description of “plagiarism,” see [URL removed] Cheating For a thorough description of “cheating,” see [URL removed] For this course, the use of AI tools such as ChatGPT to complete written assignments is considered cheating, and if detected, will have a negative impact on your grade.

Q11: To the best of your knowledge, how is generative AI currently being used in undergraduate courses in your unit? (Check all that apply.)

N = 55. Respondents could select multiple options.

Response	Count	%
Discouraged or prohibited in most courses	16	29.1%
Allowed for limited tasks (e.g., brainstorming, editing)	42	76.4%
Integrated as a formal learning tool (e.g., assignments using AI)	18	32.7%
Used mainly by students on their own, without explicit guidance	24	43.6%
I don't know enough to say	6	10.9%

Q12: Please share one or two concrete examples of how AI is being used in courses.

35 responses. Identifying information has been removed to protect confidentiality.

1. It is used as a brainstorming tool in one class. In another, it is used as an empirical research tool.
2. I do suspect most instructors don't allow it. Some allow it for grammar checking. Some allow it for assignments (ex: sample day for you as a college student) and then ask students to evaluate what it spits out.
3. Some professors are encouraging students to use AI to generate ideas about curriculum plans/lesson ideas. I have used AI to show how it isn't always reliable when it comes to generating research citations
4. I allow generative AI to be used on most assignments as long as students cite how they are using it. There are also several courses that have project involving generative AI.
5. Nothing specific
6. Editing work- making language more concise.
7. Students use coding tools to generate functions and syntactically correct code in [a course] "DC circuits and microcontrollers." This lets the course focus more on the important learning outcomes like control systems and usability rather than on coding mistakes and troubleshooting.
8. Many professors explicitly prohibit its use. But those that do have been asked to explicitly state when and where it is appropriate. Some courses intentionally incorporate generative AI to help students learn about its possibilities and limitations. But mostly, instructors seem to explicitly forbid the use of generative AI to construct texts.
9. [a course] a STEM course): Students are encouraged to use a "Socratic AI Chatbot" to reinforce learning through dialogue. The user starts with a prompt like "let's talk about Topic X". The chatbot will then help the user refine their understanding of that topic by facilitating learning through the Socratic method. It prompts users to explain concepts, asks probing questions,

identifies and addresses misunderstandings. [a course] (Modern a STEM program): Use AI actively to solve higher-level problems and develop simulations of physical phenomena. Sample problem: "Generate an AI simulation that explores your work from one of the above problems a) Submit the prompt you used to generate your simulation. b) Verify that the simulation validates some your work from a previous question. Provide evidence showing how this is true. (If you cannot tell if the simulation validates your work you need change AI models or continue to work on your prompt until the simulation gives you something concrete.) c) Identify and document three insights or errors that you could find by playing with your simulation. These could be things that you suddenly understand from working with the simulation, or these could be errors that the AI has made because it does not understand the physics but you do.

10. I have discussed using AI as a means to tutor themselves and create study materials.
11. We have some courses where AI is prohibited (e.g., intro writing courses, ethics courses). Some other courses allow limited use for brainstorming, editing, etc. For example, in most of our 491 capstone course, each instructor assigned articles about how our industry was using GenAI, then each course had a discussion about how GenAI could and could not be used in the course based on industry best practices. In this way, each class co-wrote a GenAI policy with their instructor. Overall, the consensus was that AI is a good tool for helping to generate ideas, but that it should never be used for the final work – we don't ever copy/paste/submit from GenAI. Students are also required to include a GenAI statement on each assignment describing which tools they used and how, along with some sample prompts. So far, this seems to be working well. We have other classes where students are required to use GenAI ([a course], [a course], [a course]). In these courses, we are specifically teaching students how to integrate GenAI tools into their workflow in ways that are mimic how heavy AI adopters in the industry are using the tools.
12. One faculty member uses AI in a chatbot format to have students interact with it in simple conversations to practice new oral communication concepts in 101 and 102. Another has students use AI as a planning tool for case studies in an international business format.
13. Several of our courses involve simulations - students are assigned parts to simulate real historical debates. CELT helped us develop a chat bot that can help students prepare for their assigned roles by asking them questions tailored to their particular point of view. That is one example.
14. Editing papers; coming up with ideas for paper topics.
15. In [a course], a first-year [a skills course] dry lab, students use UK-provided Microsoft 365 Copilot to summarize research papers that are beyond their scope of understanding. In [a course], the a STEM program of Sex, students engage with generative AI by having AI generate written materials that are then scrutinized for accuracy.
16. AI tutors, guided AI tutors, NotebookLM
17. It is used broadly by faculty across the program, including encouraging use for idea generation/brainstorming, editing, gap identification, practice debates, practice interviews, etc. Some courses have had students use GenAI for initial information, then had them fact check and edit outputs to help students understand strengths and limitations of the resource. Currently student experience varies by faculty - we have quite a few faculty training students on usage, but it is not currently a required component in any course. We plan to add that into an upcoming program change.
18. In most courses it is prohibited. In a limited number it is allowed for editing drafts of a statement.

19. programming for senior design project; editing technical writing deliverables.
20. - In a module on scientific writing, using AI to generate a paragraph with citations and then critically evaluate the writing and sources to find errors - Generate B-roll ideas for a student topic in a 60-second documentary
21. One course has been designed to teach students how to understand and evaluation large language models (the topic of the class is communicating with AI). Other courses allow AI as a tool to check grammar and writing, or require students to cite AI if AI has been used (to generate ideas, to find sources, to draft writing).
22. In our undergraduate methods course, students are allowed to use it to try to find errors in their R code. In other courses it is completely prohibited. Another course they are encouraged to use it to generate information and then double-check the information that it provides.
23. Used to generate R code, with citation
24. AI is often used for brainstorming activities- when brainstorming paper or project ideas for example. AI is also often used to assist students with improving writing mechanics.
25. Students use solutions from AI for homework.
26. 1. To support brainstorming of ideas for engineering problems. 2. Feedback on data analysis. 3. Understanding current trends in topic areas.
27. In my own courses, I provide guidelines for each assignment regarding how genAI can be used in any step of its completion. Typically, there is no AI use allowed except on a couple of assignments. I know other teaching colleagues allow AI on all assignments in the brainstorming/editing phase. I think our department represents the wide spectrum of opinions on AI use in classrooms.
28. For students- I consistently get assignments composed entirely by AI. Students will just put in a prompt and hand in what is produced. I have integrated workshops into my writing classes about how to use AI responsibly-- that is to say using it for brainstorming, thesis finesse, proofreading but NOT for creating and composing ideas that are not the students own. This distinction is very fuzzy for students. They simply want to put an assignment into AI and not worry about the results.
29. For editing and headline writing discussions in [a course]: News Editing
30. From the faculty side, some professors allow students to help them generate ideas, especially if they are writing about a common author or text and there is a lot of information out there. Most of the professors are ok with students using Grammarly or other tools to help polish their writing. From the student side, they are using it to produce work with little to no effort. Whenever they can, some students will use AI to write essays or other forms of writing that are assigned to be completed at home. Also, many students are using AI to tell them what a book or a movie is about rather than read or watch it themselves.
31. Allowed for brainstorming or editing but students must share prompts
32. My department has two courses on writing with AI: one on the undergrad and one on the graduate level. AI use in other classes is decided by the instructor of record of those classes.
33. I am not sure if/how other faculty in my department are using AI in their courses. However, I developed a few lectures in my courses that introduce what GenAI is and the ethical concerns. I

also provided students with options to use AI for brainstorming/outlining and showed them how to use a few platforms for various tasks.

34. I have used a 1 to 2 day "workshop" style class for my lab course. We go over the basics of how you can use GenAI as a writing proofreader to modify existing writing examples they have to clarify, change audience, etc. This was developed with the help of CELT and the TII program.

35. I only allow report spelling and grammar corrections and basic data retrieval.

Q13: How concerned are faculty in your unit about academic integrity issues related to generative AI?

N = 50. Mean = 4.2. Median = 5. Scale: 1 = Not at all concerned, 5 = Extremely concerned.

Response	Count	%
1	1	2%
2	3	6%
3	7	14%
4	13	26%
5	26	52%

Q14: What are the most significant integrity-related concerns you are hearing from faculty?

43 responses. Identifying information has been removed to protect confidentiality.

1. Many times, it's hard to determine whether work that has been submitted was created by AI or the student.
2. How to handle improper use. Students are using it to write papers and other assignments where they aren't permitted to. We don't know what to do about it.
3. In engineering, there is a great concern that AI is being used for assignments where actually learning the material is critical. Especially as in many areas of engineering, designing systems safe for human use is a priority.
4. Decrease in critical thinking skills and misunderstanding of plagiarism.
5. Guidance on using platforms responsibly for use for both students and instructors.
6. The biggest concern is students are going to continue to heavily rely on AI to do their work and thinking. Students don't care about the learning and thinking process anymore. It seems that they just want to get an assignment completed thus they lean on AI. This may be because we, as instructors, need to find different ways to engage our students.
7. Many of our instructors are concerned about students submitting work (especially essays) that were fully or partially written by generative AI. Unlike traditional plagiarism, allegations of generative AI misuse are difficult and sometimes impossible to prove.

8. Mostly from our Art a humanities program Area and Art Education Area concerning written papers.
9. Students using AI to complete work and listing fake references
10. That it is being used by both students and administration rather than those folks actually thinking and writing their own words
11. AI can now one-shot most homework. Unfortunately, homework has well-defined and well-scoped problem statements with defined answers. Faculty have mentioned reducing the weight of homework assignments and increasing the weight of other assessment methods.
12. There is a general feeling of powerlessness. These tools have been released onto the market with seemingly little regard for how they might impact our work. The university seems to be embracing them at a high level even though they are creating significant concern and questions in our classes. It's impractical (if not impossible—and sometimes unethical) to monitor student use of these tools, so it's unclear how much having a class policy actually changes anything.
13. One of the most significant concerns is that even if we forbid its use, we cannot guarantee that if we suspect its use, there will be consequences for the student. In fact, trying to accuse or get a student to admit to their use of it is an extremely awkward and painful experience, and in most of our cases so far—even in egregiously obvious cases where part of their prompt to AI was included, they defend themselves and accuse the instructor of bias.
14. Concerns that students will use AI to do their homework. Many of our instructors are addressing this concern by giving higher weight to in-class exams and less to homework assignments. Students are reminded that the best way to prepare for an exam is to do the homework largely on their own.
15. The substitution of integrative learning with AI-generated responses that mimic such learning.
16. We still need to teach students to write well (without reliance on GenAI), to think critically and to make ethical decisions.
17. Plagiarism in the form of submitting work as if it were their own when students have employed AI software to complete the assignment, or write it completely. Also, the significant cognitive deficits that we are seeing across the board with incoming cohorts means that these students more often turn to AI to complete foundational tasks, which leaves them without the skills they need for higher order learning without again resorting to artificial learning.
18. Many of the assignments we have given in the past are now completely AI'able. We are having to rethink how we design instruction. Traditional research papers are now problematic.
19. The difficulty with assessing writing assignments. The difficulty with assessing take home work of any kind. The difficulty in helping students experience engage with reading and writing of any length. The difficulty in helping students understand that AI could be hurting their intellectual development.
20. There are literally no tools on hand to detect, measure, and prove the usage of AI in any digital product. So, since we are all under resourced and disincentivized from spending much time on individual assessments based on the new DOE guidelines, there seems no functional way to limit student AI usage in the absence of institutionally-provided tools (e.g., through canvas), which don't exist nor will ever probably be good enough to use.
21. The need to revised testing methods

22. Challenges with assessments, including multiple choice, short answer, and written projects, when completed outside of a controlled classroom setting. Concerns with online course assessments. Less knowledge retention of core content seen in some students since the rise in AI usage, and that is building concerns that they may be learning to use AI, but not fully learning the discipline content in the ways students did in the past.
23. Creating images of building designs that are AI generated.
24. How to design assignments that can assess student understanding at a time when AI is rampant
25. What is best for student learning?
26. 1. Online coursework, rampant AI use 2. Students using AI for coursework and then not being as prepared for exams, perceiving them as more difficult than students did in the past 3. Writing assignments (both essay and shorter answer)
27. We would like the university to provide guidance and support for preventing dishonest use of AI (e.g. student uses AI to write a paper from start to finish, student uses AI to answer exam questions) and the enforcing violations of these types of academic dishonesty.
28. That students don't see it as a violation of academic integrity, and the current systems that exist often side with the students, even when there is clear evidence of cheating.
29. online projects and exams
30. Faculty are concerned about student learning and critical thinking being lost with use of AI.
31. There is a clear issue with writing assignments. Faculty are not clear on how to control this.
32. Students using AI to write reports and answer questions for assignments. This degrades the critical thinking skills of our students.
33. I think enforcing and defining AI use within the realm of academic integrity is more difficult when AI use is allowed. Its use cannot always be easily proved or discerned without students citing, which they likely will not do.
34. That students do not care about creating their own work. They can simply have it produced by AI and turn it in. They do not understand 1. how AI sources information and 2. that it is not their own work and is thus plagiarism/ cheating. The students are skipping the learning process of critical thinking and simply letting AI do it for them.
35. How to detect it when not permitted.
36. We're supposed to be churning out creators, writers, original thinkers in our major, but we worry that students are too focused on just getting assignments done in time, so they're falling back on AI to do most things.
37. Students are unwilling or unable to produce their own work or to rely on their own interpretive skills. As a field, a humanities program is struggling to find ways to get students to do their own work. As I mentioned previously, AI-written work is rampant and without tools that can detect it we feel powerless to hold students accountable. More, we struggle to get students to read or watch movies. They rely on AI for summaries.
38. Future Students will not know how to write without ai assistance
39. Increase in the number of essays written entirely by AI.

40. Faculty are extremely concerned that students are using AI to complete assignments and are not learning how to read academic literature, write, or think critically
41. For people in our department and Engineering in general, I hear a lot of concern with using GenAI to bypass the learning process, having it come up with answers to assigned assignments on any assignment that might be written or done outside class and controlled testing environments.
42. Instructors are committed to helping students develop their critical thinking, reading, and writing skills and are thus concerned about the many ways generative AI will inhibit that crucial intellectual growth.
43. We are concerned that students do not put in the effort or thought to obtain answers or results.

Q15: In your view, what are the most pressing needs or challenges your unit faces regarding generative AI in undergraduate education?

47 responses. Identifying information has been removed to protect confidentiality.

1. Our faculty need to get up to speed with how to use AI and what the pitfalls are so that we can better guide our students and add it to their "toolbox" in a constructive way.
2. How to still get students to think critically on their own (generally) and produce their own writing samples (specifically).
3. I am greatly concerned about graduating engineers who do not really understand their engineering discipline because they used AI to shortcut the learning process.
4. How to train students to use it ethically (and to understand its broader ethical concerns) while also having faculty trained on its ethical teaching.
5. Relying too much on AI for credible information and critical thinking.
6. How to teach students to ethically and correctly use AI
7. I worry that since AI is capable of writing essays, students will no longer see the value in doing so themselves if they aren't clearly informed of things like the cognitive benefits.
8. Figuring out how to teach fundamental computing concepts (like programming) in conjunction with AI use. In my view, we don't want AI to supplant teaching these concepts, but outright forbidding AI will likely have the opposite effect.
9. We are worried about students cheating themselves out of personal discovery and growth.
10. Same as previous response- fake resources, using AI for discussion posts and to write their papers
11. Pretty sure it's going to ruin a generation of thinkers
12. We need to figure out how to integrate it. Our advisory board was quite clear that graduates are expected to use these tools and use them well. They need the basic engineering skills but they need to apply those skills through these tools.
13. We need support in knowing how to create and enforce policy. We need continued agency in making our own policies for our classrooms, even if other programs (or even classes within our

programs) have different policies. We want to feel like our concerns and worries are heard and echoed by the university instead of wondering if the institution's priorities are going to leave us behind.

14. One of the most pressing needs is convincing students that it does them few favors in their education. I think students use it as a crutch to their own detriment. The more they use it, the more "tired" their brains feel, and the less they feel confident in their own ability to think creatively or constructively. The other side to this equation is that students use it because many assignments do seem pointless, tedious, etc. Thus, instructors need to be much more creative in how they educate and understand that the same old methods often were not great to begin with, and that if they want students to not use generative AI, they need to grow in their pedagogical approaches.
15. The most pressing need is that we need to reorganize undergraduate education around AI, so that students learn to use it effectively in a variety of contexts. AI skills will be among the most important workplace skills for graduates entering the job market in the coming years.
16. Strategies and methods to teach students how to use AI properly and in a manner that contributes to the development and refinement of critical thinking and creative skills
17. How to ensure that students truly learn and think rather than simply looking for an answer and submitting AI slop. We need student to see AI as a tool that can help in some situations, but is not the right answer for every situation. Also, that AI should be viewed as a partner, not a replacement, for human thinking.
18. Instilling the understanding that AI is not a replacement for learning to think creatively and critically. AI software is one of many tools, not the only tool, that are designed to free up time and space for innovative thinking and creative problem solving by taking over the repetitive tasks.
19. We are concerned about the ways UK Core locks us into very traditional assignments, when we know those are now are the easiest to cheat, using AI.
20. Students will no longer know how to communicate in writing without help, which will affect their ability to communicate generally. Social implications of students' further reliance on and use of screens and technology rather than human interaction.
21. We need leadership to help us see our path forward in a world where it exists and stop lamenting its existence.
22. Since our new DOE guidelines prohibit spending meaningful time assessing individual student work, what tools is UK planning on providing that help us deal with AI usage? In the absense of meaningful infrastructure, most students will use AI to do all of their digital coursework and engagements without any immediate repercussion, and then we just turn into a comical, performative degree mill because faculty are incentivized to drive enrollment at the expense of course quality.
23. How best to communicate the need for all students to use AI. Some students are still reluctant.
24. The most common use of AI is for writing reports. There is not consensus on how this should be handled. AI is not yet able to produce correct answers for much of the content of many of our courses.

25. How to ensure basic skill development needed for higher level skills, when the base skills may be completed by AI. Assessments when AI can answer most multiple choice or short answer questions on general content extremely well.
26. Not fully grasping the challenges it presents.
27. modifying assessments (particularly assignments outside of class time)
28. Figuring out what is best for student learning.
29. A need to better convey to students the downsides of reliance on it outside of academic misconduct: not being as prepared for exams/poor retention of material, loss of chance to sharpen critical thinking skills, risk of being less able to produce knowledge on the spot in conversations in class and career work. Student brains are still developing at this age, so they are not always going to be able to understand the longer term concerns, and they would understandably choose an easier path. How do we incorporate it into our classes while helping students understand it shouldn't be used all the time for everything?
30. That it is moving quicker than policy and we are trying to find ways to ensure that the students actually learn and leave the University with skills, but there are limited resources to support these efforts at the University and that there is no clear communication from the University to the students about violations of rules regarding AI.
31. academic integrity
32. ensuring students have enough foundational knowledge to be able to critically assess whether information given by Gen AI is correct
33. Pressing needs include determining how to balance the inevitable use of AI as well as employer demands that students know how to use it while still teaching students how to think and learn as well as considering the ethical challenges with use of AI (water consumption, environmental concerns, etc.).
34. Enforceable guidelines would be helpful. The key is that the administration must not be only willing but encourage academic misconduct penalties. Placing student conduct rules under Student Success is frankly baffling.
35. I feel it's changing so much that it is difficult to determine what potential jobs are going to be affected. And it makes it difficult to advise students. I think I'm ok with the disruption on classes and how they are taught but I'm more worried about what to tell students on how to prepare for 5 year out.
36. How to use AI to support analysis and understanding of topics instead of using AI as the definitive source to arrive at a correct conclusion/answer.
37. Speaking from the perspective of someone who is largely anti-AI, I worry about real student learning and how to create meaningful assignments and evaluation metrics when they can use AI to do just about everything. Shifting to on-paper, in-person assignments and exams is great, but not always feasible for everything.
38. Students need to be made aware of the limits and uses of AI more broadly. It is an important skill to learn but it needs to be a skill, not an entire academic career. Students think they can simply put each assignment into an AI generator and submit what is turned out without actually learning any material. This is a HUGE problem.

39. Ensuring students use it in permitted ways. How to detect it. What are appropriate responses when it is so prevalent.
40. We have two issues: Training future professionals in our field on how AI is being used in industry ethically and to save time and do important work. And then in more theory based classes on our discipline, we're deeply concerned that it's being used to write papers and reflection journals, etc.
41. a humanities program professors, and the humanities in general, are in crisis about AI. We feel there is little to no institutional support, or even societal support, for teaching students that AI generated ideas and content is not the same as thinking and writing for themselves. We're struggling to adjust our pedagogy to find ways to avoid AI. Without reliable tools that identify AI, or without the backing of an institution that takes a hard stance on it use, we worry that our discipline is being diminished if not threatened.
42. Helping students navigate their changing options for the future
43. Ensuring students can conceive, compose, and organize original thoughts on their own without AI assistance. Ensuring the work we do as teachers of writing is valued in an environment increasingly enamored by the shortcuts to thinking provided by AI.
44. Addressing academic integrity
45. The amount of time and effort that must be dedicated to incorporating new GenAI instructional content into class and developing new assignments that can work with GenAI when applicable or eliminate its potential use when necessary.
46. One of the most pressing challenges is the risk of widespread, unregulated use of generative AI by students.
47. It would be great if there was a way to verify whether and to what extent generative AI was actually used in completing assignments.

Q16: What would your unit need to feel confident and effective in addressing generative AI in teaching and learning?

45 responses. Identifying information has been removed to protect confidentiality.

1. Probably more experience with using it ourselves
2. Perhaps some sample assignments that could be used Guidance on how to handle situations where it is not permitted but we know students are using it Exposure to different platforms and their usefulness
3. Honestly, I'm not really sure.
4. Training and dedicated time.
5. Examples of how it can be used responsibly.
6. Perhaps some further university guidance on expectations of AI usage both among students and faculty, specifically as it relates to composition.
7. In our department, I think we would benefit from direct guidance and examples of how to use AI on various types of assignments. Example assignments could be good as well.

8. A group workshop with the school of art might be helpful.
9. Clear policies and supported processes in place to address concerns of misuse.
10. Would love the issue of water bankruptcy to be addressed and solved
11. I think it is moving too fast for anyone to actually be confident. If you are confident, you are probably wrong and way behind.
12. Knowing that the university will support us in developing and enforcing our own individual policies.
13. Most helpful has been direct guidance with other instructors working on this issue, course design and setup guidance, and troubleshooting with one another as a body.
14. More practice using it. For those who don't know where to start, libraries of examples of AI usage in our discipline and workshops.
15. Concrete materials that are customized to our specific area of study.
16. A university system that supports teachers in GenAI cheating cases. The current system is very cumbersome for both teachers and administrators, and results vary widely. I fully agree that student rights should be protected, but with the rampant AI cheating, perhaps the university could consider a different "track" for GenAI cases vs other forms of student cheating. Our professors are smart and diligent, and we are working hard to thoughtfully integrate GenAI into our classes in a way that mimics the industry best practices. But some students are not interested in best practices, they are only looking to use GenAI as a shortcut around true learning.
17. No idea
18. Not sure. But we are scared.
19. training; lists of possible uses
20. leadership
21. No.
22. Experience using it
23. Continuous training opportunities as GenAI continues to evolve
24. Clear guidance on the expectations for responsible AI use and concrete examples of how to implement.
25. I feel we have trained well in this space in our college, but it is currently a choice to participate - I worry requiring faculty to incorporate AI into classes will result in a major rise in concerns around lack of expertise.
26. More internal discussions to develop policies about AI
27. best practices, ideas for ensuring assignment clarity
28. Time
29. Best practices, easy summaries of each AI source and what they are capable of, examples of how to use it to elevate learning outcomes
30. Supported by the University in that what we put in our syllabi matters and is enforceable.

31. some conversations on how to use it well and how to maintain academic integrity
32. more practice developing and using appropriate and effective prompts
33. This varies quite a bit in our unit- many don't want to use it at all due to environmental concerns while some embrace it as a new technology that students need to understand how to use responsibly.
34. We have to give exams with no calculators, etc.
35. We went through a series of disruptions, typewriter to computers to internet. We will be fine. Embrace it.
36. I think focused training for faculty to help everyone understand how to safely integrate AI tools into their courses to support student learning.
37. NA unless they have a deep working understanding of the technology utilized in AI development and machine learning.
38. Training on how to approach AI properly in the classroom. It is not going anywhere. Professors and instructors need to know how to adapt and utilize it in the classroom. If it is forbidden, students just want to use it more and become more crafty in hiding it. It does not solve the problem of students cheating and not actually getting an education.
39. More familiarity with how students use it.
40. A Turn-It In style device that can help us determine what's real, what's fake and what's been generated by something other than students in a real, accurate way.
41. We need to feel that our students are doing their own work. There needs to be a full throated, institution-wide defense of the humanities. We need to push back on the infiltration of AI into all aspects of education. Just because it works in some disciplines doesn't mean it works in ours.
42. Specific instruction on AI capabilities
43. Respect for our expertise and job security.
44. Please continue to provide workshops. For those of use who have attended them in the past feel much better prepared to address the changing landscape. More guidance on how to handle academic honesty would be very helpful
45. Learning resources for how to effectively use the technology and evaluate it critically. Examples and ideas for effective assignment design in the age of AI.

Q17: What forms of support would be most useful for your unit? (Select up to three.)

N = 55. Respondents could select multiple options.

Response	Count	%
Workshops or training sessions for faculty	34	61.8%
Sample syllabus statements and policy templates	24	43.6%
Assignment redesign consultations	30	54.5%
Guidance on academic integrity and misconduct procedures	28	50.9%
Student-facing resources	29	52.7%
Communities of practice or faculty learning groups	25	45.5%
Other	3	5.5%

Q18: How high a priority is support around generative AI for your unit over the next 12 months?

N = 49. Mean = 3.71. Median = 4. Scale: 1 = Very low priority, 5 = Very high priority.

Response	Count	%
1	2	4.1%
2	2	4.1%
3	13	26.5%
4	23	46.9%
5	9	18.4%

Q19: Would you be interested in a follow-up conversation or consultation about generative AI in your unit?

N = 49.

Response	Count	%
Yes	19	38.8%
Maybe	16	32.7%
No	14	28.6%

Q21: Is there anything else you would like us to know about generative AI needs, opportunities, or concerns in your unit?

13 responses. Identifying information has been removed to protect confidentiality.

1. I feel that composition education is one of the areas most impacted by AI usage, and high level discussions about it could be helpful.
2. No
3. Growing a culture of students who choose to go "straight edge" and not rely on generative AI when not asked for their own brains --making it cool, tough, manly, honest, whatever-- can be enormously helpful, but also as necessary would be growing faculty commitment to excellence in pedagogy and real intentionality and appropriateness in assignment creation and load. Both are uphill battles, but unless the hearts of the people on all sides of the issue are in it, it won't change. Thank you!
4. The ethical and climate implications of supporting a rampant AI agenda at the University put our KY communities at risk in a multitude of ways, including increasing the cost of living and compromising water and electrical supply chains for hundreds of thousands of Kentuckians.
5. thanks for the survey
6. Either provide us with useful AI utilization tools or give us the time and space to develop meaningful assessments and course structures that permit truly creative work. Otherwise, UK will become a degree mill.
7. No
8. Not currently.
9. no
10. Many of our faculty simply will not utilize AI in their classrooms or personal/professional lives until environmental concerns are addressed world wide.
11. I think the key is that the administration needs to place a priority on controlling the use.
12. Thank you for this survey
13. no
